Global Electric Vehicle Outlook 2015

The Global Electric Vehicle Outlook represents the collective effort of seven years of primary data gathering and analysis from the Electric Vehicle Initiative's 16 member governments. Overall, electric vehicles and charging infrastructure deployment has continued growing since the 2013 outlook. Battery costs have come down while energy density has climbed; vehicle electrification has gone multi-modal with 46,000 electric buses and 235 million electric two-wheelers deployed; and total electric vehicle spending by the member governments equaled 16 billion USD between 2008-2014.
